

What you need to know about Gas Props

1. What is the length of your prop?

We stock several different props in various lengths. If we do not have the exact part number you are looking for, we will need the extended and compressed length so we can best match your prop.

2. What kind of end fittings do you have?

Depending on the application, there are many different end fitting styles. The four basic types are shown below. Socket ends fit over a 10mm or 13mm ball stud and clevis ends have a hole all the way through them and fit over a post like stud. Our standard clevis ends are about 1/2" thick. We do not stock the thinner 3/16" flat clevis end.

10mm Black
Plastic Socket

13mm Zinc
Socket

Standard 1/2"
Thick Clevis

Thin 3/16"
Thick Clevis

3. What is the pressure for your prop?

Most props have a pressure rating on them. If they do not reference "lbs" then most likely they will have a 4-digit number with an "N" at the end. Example: 0110N. With this number we can determine the pressure for you.

There are many different brands of gas props, but with a little information from you, we can match your props to ones we have in stock.
